**Keywords:** travis, continuous integration, publishing, reproducibility

Travis-CI [4] is a fully hosted continuous integration environment for projects on GitHub. I've built a small tool [1] called `r-travis` that makes it easy to use Travis for automated testing of *R* packages, which is already enabled for over 200 packages [5] on GitHub.

I'll talk about Travis, how it works with R, and give a sample of what people are using it for – from testing R packages [2], to automated publishing of books [6] and blogs [3], and more.
